

Ques Find the  $n^{\text{th}}$  node from end of LL.  
(where  $n < \text{length of LL}$ )

A  $\rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6 \rightarrow \text{null}$   
 $\rightarrow$  2<sup>nd</sup> node from end of A Answer  $\rightarrow 5$

2<sup>th</sup> node from end =  $(\text{len} - 2 + 1)^{\text{th}}$  node from start

$n^{\text{th}}$   $\rightarrow (\text{len} - n + 1)^{\text{th}}$  node

$O(\text{len}) \rightarrow \text{length}$   
 $O(\text{len} - n + 1) \rightarrow \text{required Node}$

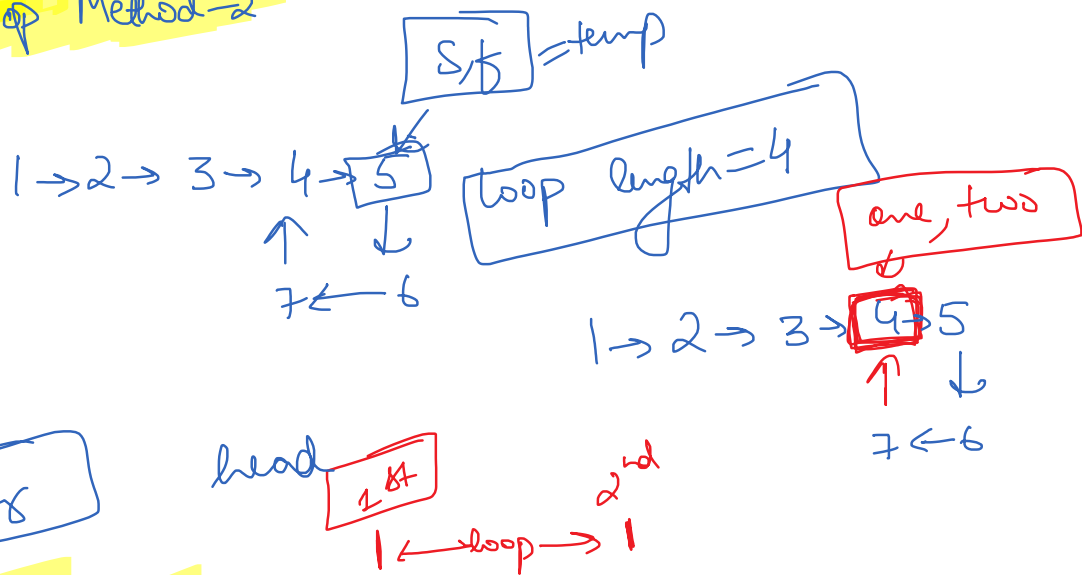

1  $\rightarrow$  2  $\rightarrow$  3  $\rightarrow$  4  $\rightarrow$  5  $\rightarrow$  6  $\rightarrow$  null  
CONCEPT?

1  $\rightarrow$  2  $\rightarrow$  3  $\rightarrow$  4  $\rightarrow$  5  $\rightarrow$  6  $\rightarrow$  7  $\rightarrow$  8  $\rightarrow$  null (while (fast != null))  
Find the 4<sup>th</sup> node from end

Find the 4<sup>th</sup> node

## Remove Loop Method-2

2 pts

## Method-3

$$\begin{aligned} \text{Distance covered by slow ptr} &= m + x \times n + k \\ \text{fast ptr} &= m + y \times n + k \end{aligned}$$

$$\begin{aligned} \text{Distance of fptr} &= 2 \times \text{Dis of sptr} \\ m + y \times n + k &= 2 \times [m + x \times n + k] \end{aligned}$$

$$m + y \times n + k = 2m + 2x \times n + 2k$$

$$m + k = n(y - 2x) \rightarrow \text{where these all are integers}$$

$m+k$  is a multiple of  $n$

slow.next = fast.next

fast.next = null
